Improving Air Quality

Tackling poor air quality and providing avenues for improvement in order to prevent adverse health outcomes

Content overview

Importance of Air Quality ➔

Communities Adversely Affected ➔

Air Quality Factors ➔

Solutions

Air quality is something that affects **everyone, everywhere, all the time.** Few individuals are in the proper positions to take action to improve air quality for any given area. Thus, it is important to **identify** some of the **most important air quality factors** to help inform policy makers on how to better serve their constituents.

Some Effects of Bad Air Quality:

Short Term Effects

- **Respiratory problems** (acute for those with existing conditions)
- Eye irritation
- Nausea

Long Term Effects

- Respiratory diseases: Chronic Bronchitis, Emphysema, COPD
- Development of **Asthma in Children**
- Cardiovascular diseases: Artery calcification, Stroke, **Heart Disease**
- Neurological problems: Cognitive decline, **Dementia**, Parkinsons

“When the city formulated its first comprehensive plan in 30 years – "Plan Lubbock 2040" – in 2018, several East Lubbock residents brought the **air quality issue** to the forefront of the conversation throughout the planning process.”

Lubbock, Texas: Race and Ethnicity, Environmental Hazards, and Land Use

Source: Race and Ethnicity Data from 2010 Census Block Data, Environmental Polluters from EPA 2017 Toxic Release Inventory, 2018 Interim Land Use Plan - City of Lubbock

- Toxic Release Inventory Sites
- Industrial Land Use 2018

Race and Ethnicity

1 Dot = 1 Person

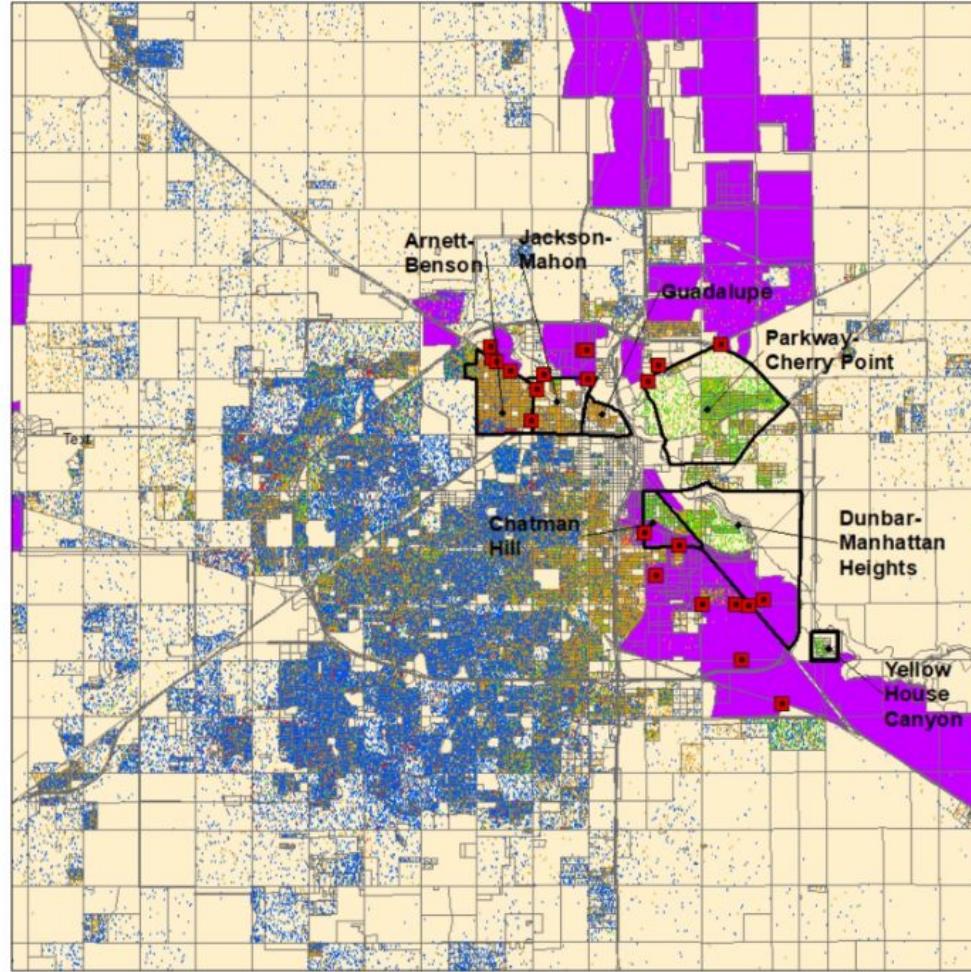

- Asian Not Hispanic
- Black Not Hispanic
- Hispanic or Latino
- White Not Hispanic

1

Note: The Toxic Release Inventory (TRI) program tracks the release of certain chemicals that may pose a risk to human health. Chemicals covered are those that cause cancer, other acute human health effects, or significant adverse environmental effects.

THE SOLUTION

Build a model that predicts the health outcome based on the air quality, identifying most impactful characteristics

01

VARIABLES TO LOOK AT

Exploratory Data Analysis highlights possible impactful variables

02

RANDOM FOREST

Random Forest gives predictions and variable importance

03

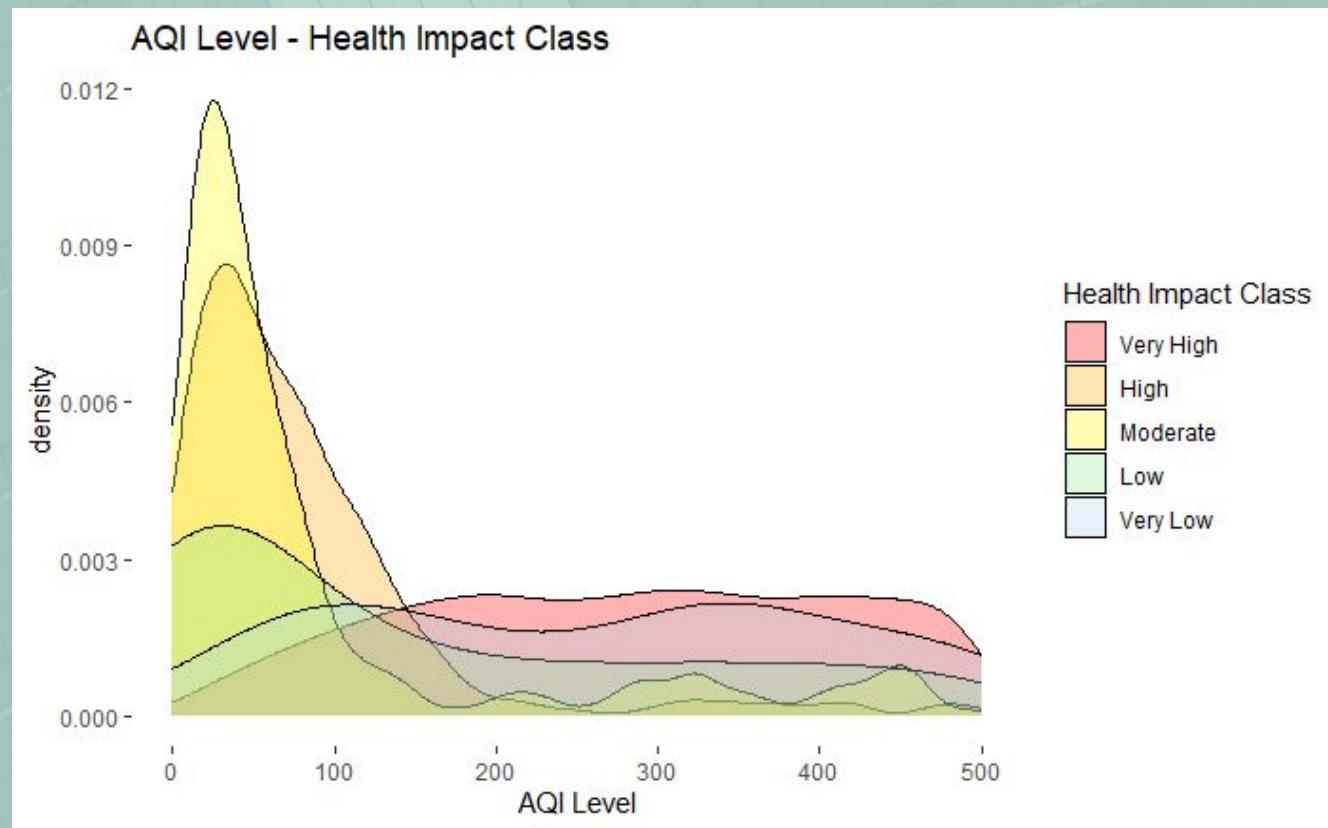

XGBOOST

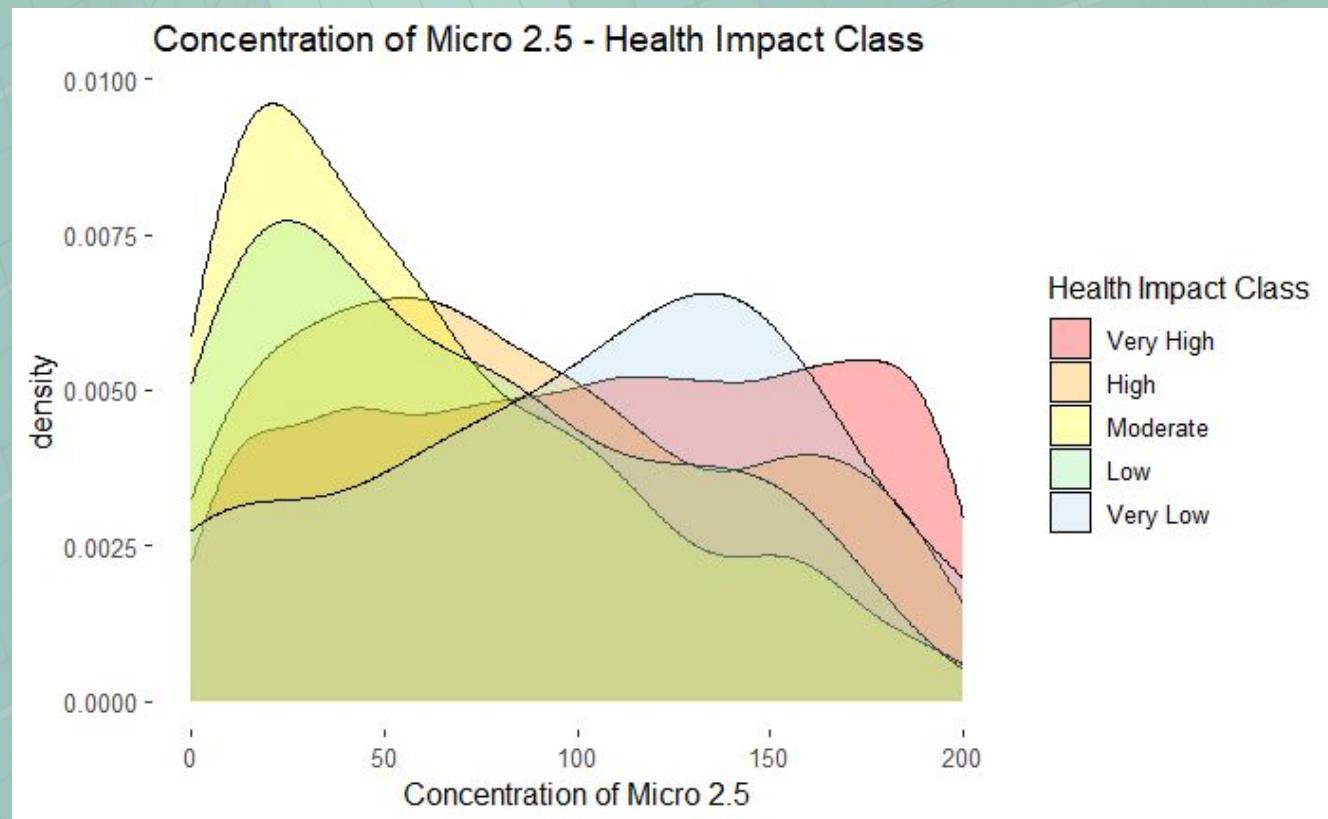

XGBoost gives predictions and variable importance

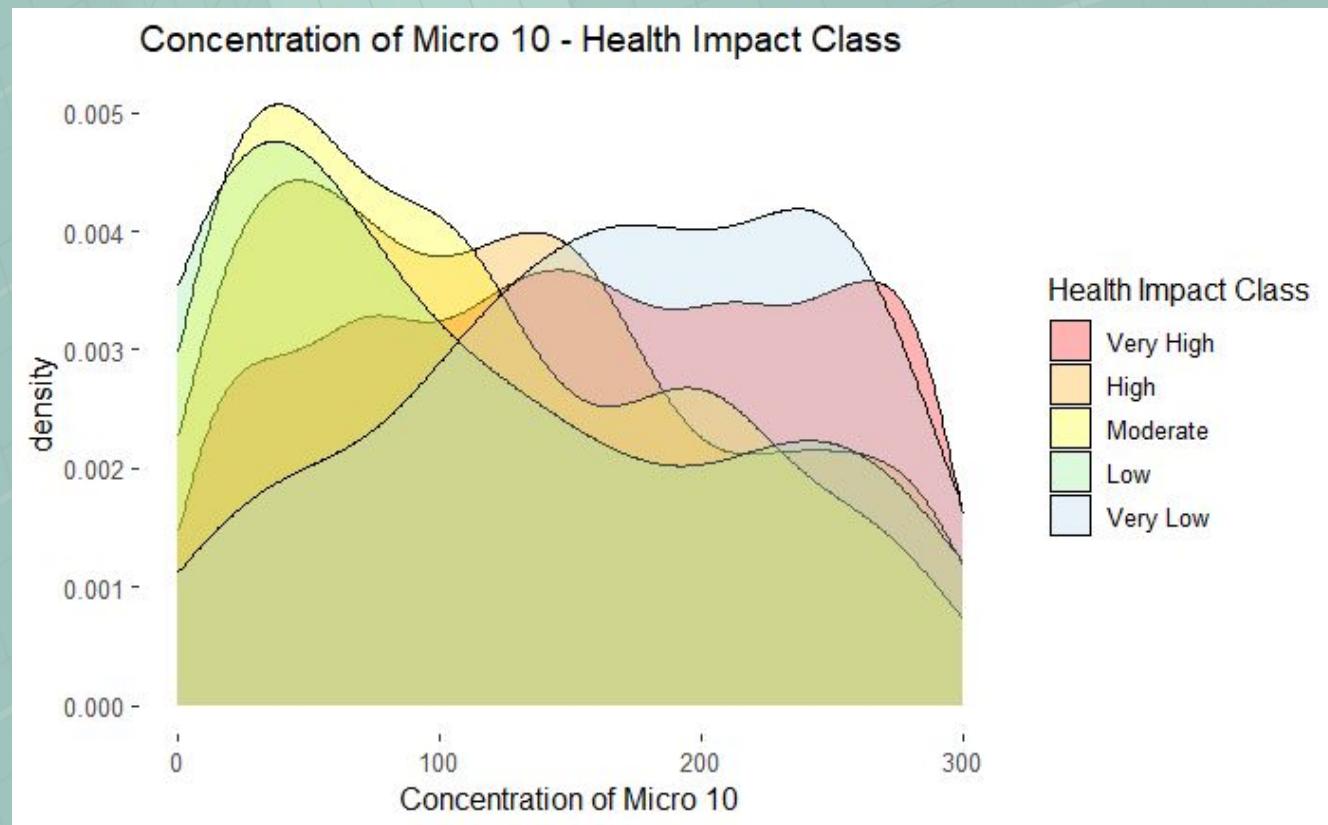

04

RECOMMENDATIONS

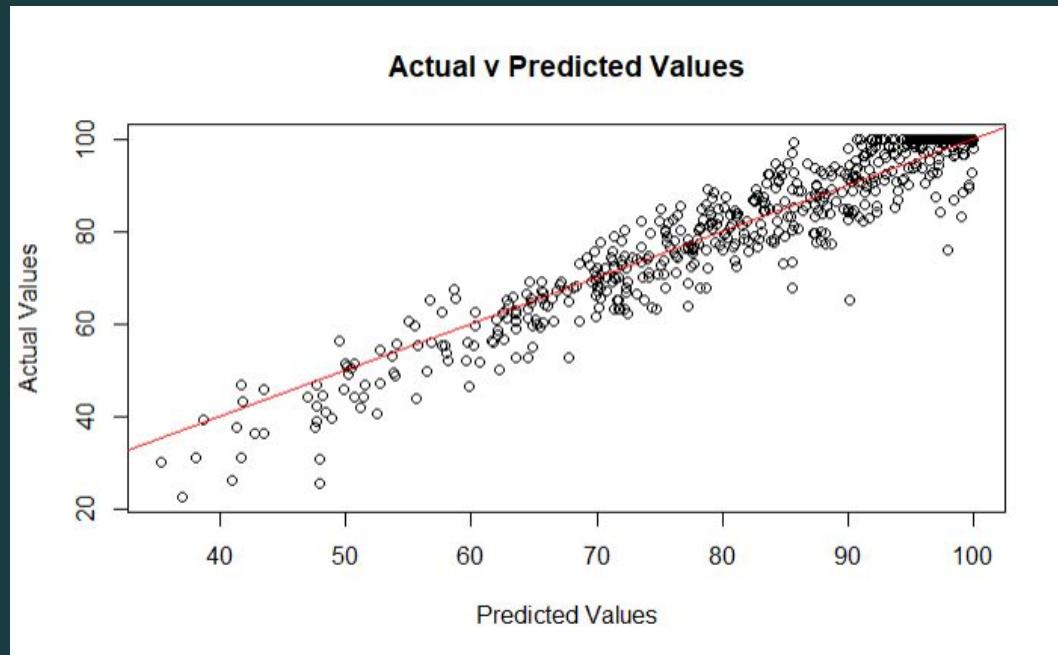

Synthesizing findings and finalizing solution

The Random Forest Model performed well in predicting Health Impact Score

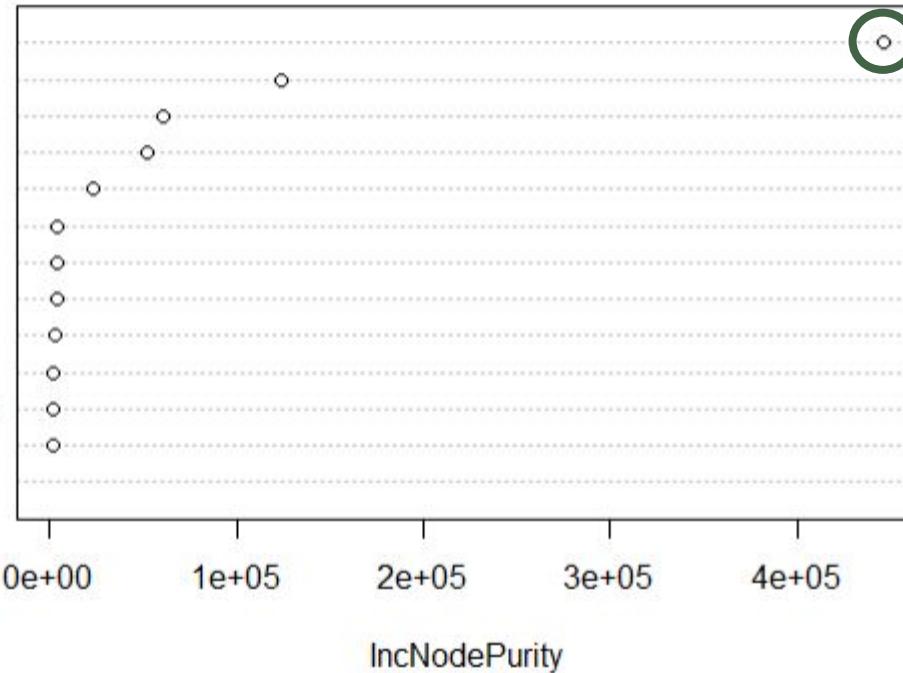

Variable Importance Ranking:

- AQI
- 2.5 particulate concentration
- 10 particulate concentration
- Ozone
- Nitrogen Dioxide
- Sulfur Dioxide
- Humidity

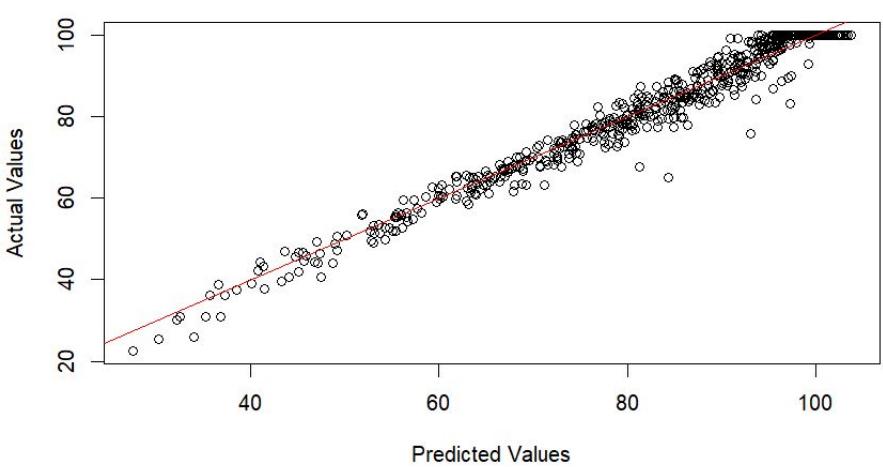

Predicting Health Class Score

AQI
Micro2_5Concen
Micro10Concen
Ozone
NitrogenDioxide
Humidity
SulfurDioxide
Temperature
WindSpeed
RespiratoryCases
CardiovascularCases
HospitalAdmissions

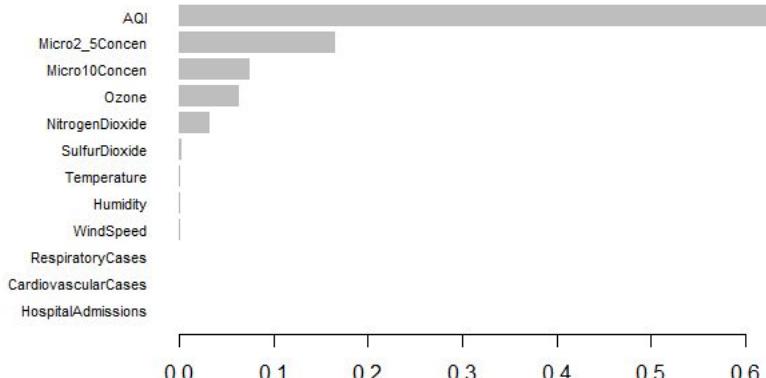

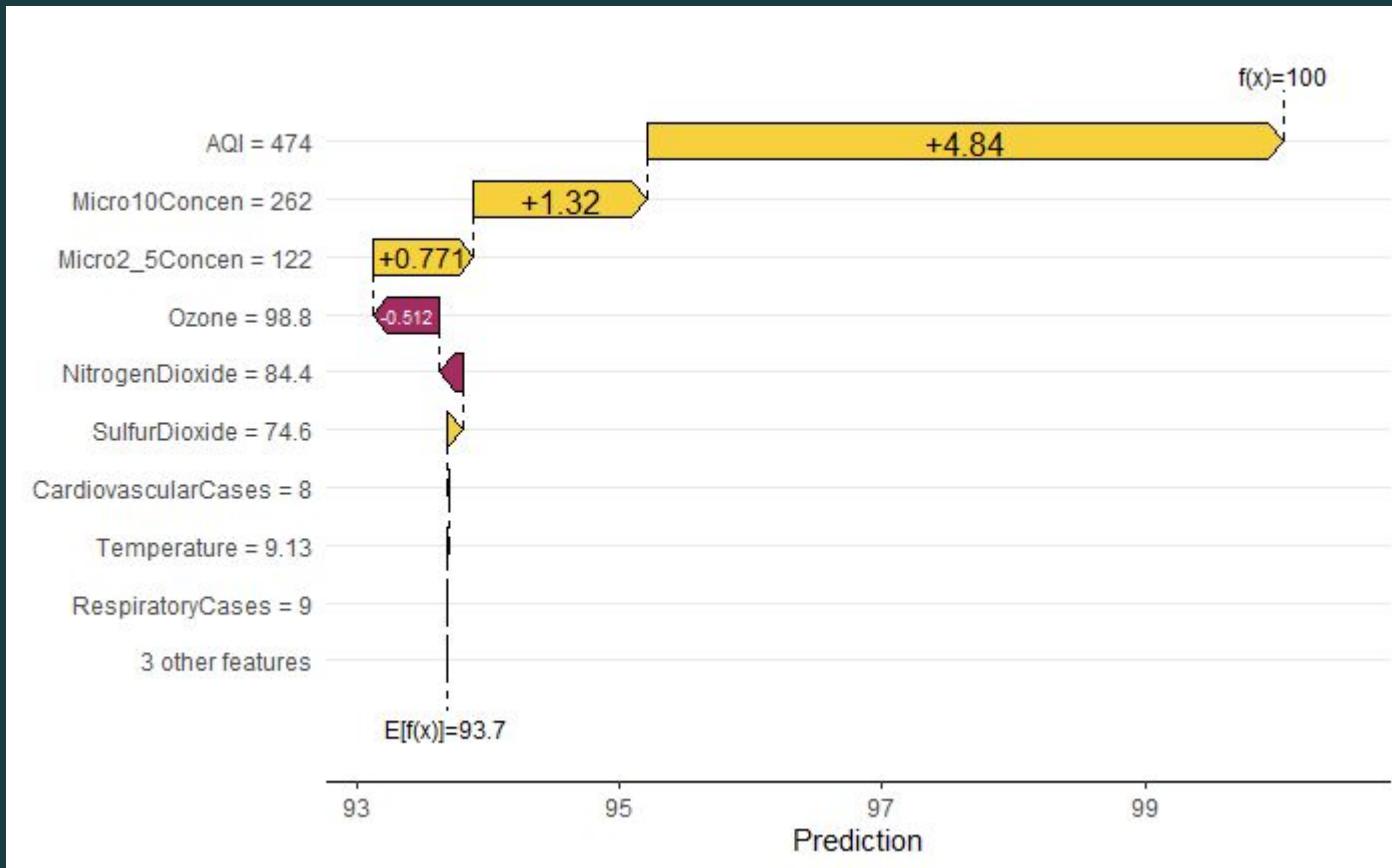

The XGBoost Model also performed well in predicting Health Impact Score

XGBOOST MODEL

Mean Square Error: 1.825984

Residuals:

Most Impactful Factors

Air Quality Index

AQI would naturally be very important here, and the next most important factors are those that are used to calculate AQI. Therefore, AQI can be used in more broad situations to look at health impact, but other factors can be targets of improvement

Particulate Matter Concentration

The concentration of particulate matter less than 2.5 or 10 micrometers in diameter are the second most impactful factors, making them important targets for improving air quality and predicting health impact

Other Factors

Ozone and Nitrogen Dioxide are also notably impactful, and can therefore be focused on when aiming to improve air quality

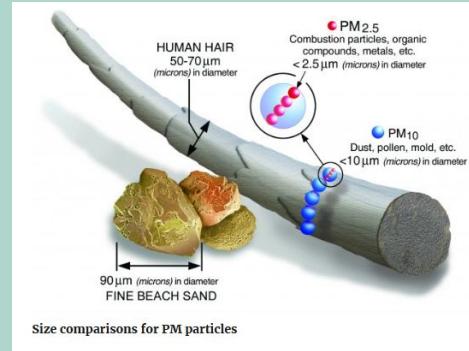

Policymakers

The EPA already sets standards for six criteria pollutants: carbon monoxide, lead, nitrogen dioxide, ozone, particle pollution, and sulfur dioxide

Given our findings, policymakers should make an effort to reduce **particle pollution** the most, followed by **ozone**, then **nitrogen dioxide**.

Furthermore, The EPA notes that particle pollution can originate from a variety of sources, including construction sites, fires, power plants, and industry.

Policymakers could strengthen regulations on the **minimum distance** from nearest residential or public use area that industry/power plants could be, as well as prioritizing efficient construction and fire prevention.

Researchers

Continue delving into methods of filtration and pollutant removal

Average Person

Monitor AQI before going outside

- Wear a mask when levels are elevated
- Invest into home air filters and purifiers

Thank you
